

Use AI to create something that improves the financial research process and provides insightful information for better decisions.

Option 1

Prediction Markets as a Financial Signal

Prediction markets like Polymarket and Kalshi price real-world events in real time, from Fed decisions and inflation prints to tariffs and elections. Build something that turns this data into insight for investors, researchers, or analysts.

Your project could

- Detect and explain sudden market moves
- Connect markets to companies they affect
- Test if markets lead or lag stock prices
- Build a monitoring tool or AI assistant

Data and tools

Polymarket, Kalshi's public API, and SEC EDGAR. Live or historical data both work, and pairing market data with filings or news could be helpful.

Option 2 (General Track)

AI for Finance

Use AI to build something that helps traders and analysts research companies, analyze markets, and make decisions.

Your project could

- Flag companies worth watching today
- Gauge company sentiment using public discourse and news
- Try any creative use of AI in finance!

Requirements

- A clearly defined user and problem
- Public datasets only
- Some form of evaluation, like a backtest

How projects are judged

Clear pain point

A defined question or user

Technical soundness

Sensible methods and sound data handling

Insight

Surfaces information that couldn't be easily seen before
